Slide 1: Title Slide

- **Title:** Software Project Life Cycle (SPLC)
- **Subtitle:** Understanding the Journey from Concept to Completion
- **Presented by:** [Your Name]

Slide 2: Introduction

- **Definition:** The Project Life Cycle is a framework of logical steps to produce high-quality software.
- **Purpose:** * Provides a structured approach to development.
    - Ensures stakeholder requirements are met.
    - Helps in resource and time management.

Slide 3: Phase 1 - Requirement Analysis

- **Goal:** To understand **what** needs to be built.
- **Activities:**
    - Interacting with **Stakeholders** to gather needs.
    - Documenting Software Requirements Specifications (SRS).
    - Feasibility study (Technical and Financial).

Slide 4: Phase 2 - Planning & Design

- **Goal:** To define **how** the software will be built.
- **Planning:** Defining the **Project Team** and scheduling tasks (Step Wise approach).
- **Design:**
    - **Architecture:** High-level structure.
    - **Detailed Design:** Database schema, UI/UX, and API definitions.

Slide 5: Phase 3 - Execution (Coding)

- **Goal:** Developing the actual product.
- **Activities:**
  - Developers write code based on the design documents.
  - Adhering to coding standards and documentation.
  - Version control management.

Slide 6: Phase 4 - Testing & Quality Assurance

- **Goal:** Ensuring the software is bug-free and functional.
- **Types of Testing:**
    - Unit Testing (individual components).
    - Integration Testing (combined modules).
    - System Testing (end-to-end functionality).
    - User Acceptance Testing (UAT).

Slide 7: Phase 5 - Deployment & Maintenance

- **Deployment:** Releasing the software to the production environment for users.
- **Maintenance:**
    - Corrective: Fixing bugs found after release.
    - Adaptive: Updating software for new environments.
    - Perfective: Adding new features based on feedback.

Slide 8: Conclusion

- A well-defined life cycle minimizes risks and "problems with software projects".
- The choice of model (Waterfall, Agile, V-Model) depends on project requirements.
- **Key Takeaway:** Consistent monitoring across the life cycle leads to project success.
